JENNA HALL

Myrtle Beach, SC | (907) 406-3730 | jhal990@wgu.edu | github.com/swejenna | jennahall.xyz

PROFESSIONAL SUMMARY

Software engineering student and Jr. Programmer/Analyst with hands-on experience building database-driven web applications (Oracle APEX, PL/SQL, JavaScript) for federal and regional fisheries management programs. Prior experience spans operational leadership as a U.S. Army CBRN Specialist and as a Temporary Supervisor managing 50-60 personnel, including building an internal database system from scratch and directly owning payroll and quality-control processes. Combines a technical background in full-stack and data-driven development with proven ability to lead, train, and problem-solve under pressure.

TECHNICAL SKILLS

Languages: C#/.NET, JavaScript/TypeScript, Python (Flask), PL/SQL, HTML/CSS, R

Frameworks & Front-End: React, Angular, Next.js, ASP.NET Core, WinForms

Data & Databases: Oracle APEX, SQL Developer, PostgreSQL, MySQL, Pandas, NumPy, Matplotlib, Seaborn, Folium

Platforms & Tools: AWS, Azure, Git/GitHub, CI/CD, REST APIs, Salesforce, Quarto, YAML/YML, Jira, UKG UltiPro

PROFESSIONAL EXPERIENCE

Jr. Programmer/Analyst — NeXus Data Solutions, LLC | *Anchorage, AK (Hybrid)*

March 2026 – Present | 30 hrs/week

Provide application development and testing support using SQL, Oracle APEX development, and analytical skills, supporting the AFSC Genetics Data Management system, PFMC Groundfish SAFE Web Portal, NPFMC Allocations Web Portal, and the NOAA AKR Fisheries Disasters Data Management Application.

- Build interactive dashboards, charts, and reports as embedded features within Oracle APEX applications using PL/SQL, JavaScript, and HTML/CSS, translating client and stakeholder requirements into scalable technical solutions across four concurrent federal/regional fisheries programs.
- Deliver a mix of public-accessible reports and confidential, permission-restricted reporting tools, supporting user groups ranging from small internal teams to agency-wide audiences of 500+ employees.
- Engineered automated, trigger-based reporting that regenerates dashboards the moment new data is uploaded to the database, removing manual refresh steps for systems that process tens of thousands of fishery data records weekly.
- Conduct structured testing and validation in SQL Developer and within Oracle APEX applications prior to production release — using manual data-entry test cases to catch defects such as "no data found" exceptions and row-by-row processing errors — resolving roughly 5 such defects across multiple applications before they reached end users.
- Track and prioritize development tasks through a Jira-based ticketing workflow (managed at the team-lead level), translating incoming requirements into scoped technical work.
- Adapt to frequently shifting project scope, budget, and allocated hours driven by client-side changes, re-prioritizing development work while maintaining delivery commitments.
- Partner directly with clients and program stakeholders to analyze functional requirements and deliver solutions that improve usability, efficiency, and data accessibility.

Temporary Supervisor — CW Resources | *Joint Base Elmendorf-Richardson (JBER), AK*

March 2023 – September 2023 | 50 hrs/week

- Designed and built, from scratch, a PostgreSQL database to replace a fragmented system of spreadsheets and paper personnel files covering the full Alaska site (80+ staff); self-taught relational schema design, joins, and views to structure employee contact information, service schedules, and primary/backup contact details.
- Reduced staff location/contact time from an average of 8-45 minutes (manually searching paper files across multiple management locations) to near-instant lookup available 24/7 on management devices — an approximate 80% reduction in retrieval time.

- Designed privilege-based access controls within the database to protect sensitive employee information, restricting confidential fields to authorized personnel only.
- Implemented a structured quality-control inspection program — biweekly scheduled inspections plus one random inspection weekly — replacing inconsistent, rushed prior inspection practices; reduced the average building deficiency rate from roughly 3 of every 10 buildings inspected to approximately 2 of 10, a 30% improvement in service quality and completion.
- Took over full ownership of weekly payroll processing for 80+ staff using UKG UltiPro (self-taught) alongside paper and electronic fingerprint sign-ins, resolving recurring delays previously caused by inconsistent sign-in records; had staff report issues directly to eliminate processing delays entirely — e.g., identified and reprocessed two weeks of back pay for an employee who had been signing in under a nickname, completing the correction within 2 hours of a payroll closing deadline.
- Coordinated daily scheduling and operations for 50-60 personnel, minimizing scheduling conflicts while maintaining zero payroll processing delays.

CBRN Specialist (74D) — U.S. Army | *Fort Richardson, AK*
June 2020 – March 2023 | 60 hrs/week | Pay Grade: E-4

- Served across 15 field missions (training exercises and joint operations) involving both simulated and real CBRN threat scenarios, performing every operational role except team lead using M4A1 Joint Chemical Agent Detector (JCAD) and Radiac Detection Systems (RDS).
- Achieved 100% threat identification accuracy across all 15 missions while reducing individual survey completion time from approximately 2 minutes on her first mission to 1 minute 20 seconds by her final mission — a 30% improvement in operational speed.
- Designed and delivered CBRN training — including MOPP (Mission Oriented Protective Posture) gear instruction and emergency response drills — to 300-400 personnel across several large-scale arctic training events, adapting Army-standard curriculum into her own instructional materials.
- Maintained 100% equipment reliability through routine calibration, inspection, and repair (including scheduled range days) of chemical detection equipment in extreme environmental conditions ranging from -40°F to 110°F, catching calibration issues before they could compromise mission readiness.

PROJECTS

Inventory Management Software — C#, WinForms (In Progress)

- Academic project building a desktop inventory management system for tracking products and their associated/unassociated component parts within a single point of sale.
- Implemented full create, read, update, and delete (CRUD) functionality for both products and parts, including the ability to associate and disassociate parts from specific products.
- Currently migrating data storage from in-memory BindingLists to a persistent database backend; planning to add one-click, on-demand inventory reporting.

F1 Tracker — Next.js, React, JavaScript/TypeScript, Tailwind CSS, Vercel

Link: f1-tracker-drab.vercel.app

- Solo-designed, built, and deployed a full-stack Formula 1 tracking web application featuring a centralized dashboard for race calendars, standings, and upcoming events, integrated with the Ergast API for live race data.
- Reduced manual lookup time by approximately 20% compared to searching multiple sources, by consolidating standings and schedule information into one responsive interface.
- Solved the project's most technically challenging component — integrating and normalizing live third-party API race data — through iterative debugging and testing.
- Used AI-assisted development paired with a tech stack chosen specifically so the underlying code and architecture could be fully understood, using the build itself as a learning tool.
- Deployed publicly via Vercel with usage tracked through Vercel Analytics; used regularly by herself, family, and friends (~5-7 users/month) as an ad-free alternative to existing F1 apps and websites.

Dashboards & Reports — Oracle APEX, SQL Developer, JavaScript

- Designed and implemented dynamic Oracle APEX dashboards using interactive bar, line, pie, and KPI visualizations to transform complex, multi-source datasets into actionable insights.
- Built interactive reports and interactive grids with filtering, aggregation, and drill-down functionality to improve end-user data accessibility and analysis speed.
- Developed modular, responsive Oracle APEX applications integrating PL/SQL and JavaScript for real-time data visualization and automated reporting workflows. (Summarized representation of ongoing client work — see Jr. Programmer/Analyst, NeXus Data Solutions above for full detail.)

Earth Fireball Impact Analysis — Python, NASApy, Pandas, NumPy, Folium, Seaborn, Matplotlib

Link: github.com/swejenna/more-projects

- Independently designed and built a data analysis tool processing 15 years of NASA's public fireball event data, inspired by NASA's open data initiative.
- Built interactive Folium maps identifying thousands of geographic impact patterns and energy correlations, revealing a significant concentration of high-energy fireball events over Russia.
- Produced Seaborn and Matplotlib visualizations highlighting the top 20 highest-energy fireball events on record, creating an accessible interface for exploring long-term astronomical impact data.

CERTIFICATIONS

Front End Development — Western Governors University • Early 2026

Awarded for completing coursework in JavaScript Programming, Web Development, and Front-End Web Development.

CompTIA Project+ (ce) — March 2026

Continuing-education cycle certification (currently active).

Front End Developer — freeCodeCamp • October 2024

EDUCATION

Bachelor of Science, Software Engineering

Western Governors University — In Progress, Expected June 2027

Relevant Coursework: Data Structures & Algorithms, Data Management I, II & III, Network & Security, Front-End Web Development, Version Control, Ethics in Tech, Software I, JavaScript Programming, Project Management, UI Design, UX Design

ADDITIONAL INFORMATION

U.S. Citizen | Veteran, U.S. Army (Honorable Discharge) | Security Clearance: Secret (Inactive, granted 2020)

Note: Include this section only when tailoring for federal (USAJOBS) or government-adjacent postings.
